

(a) Full Dynasearch QUBO, $n = 6$, $K = 15$ 

■ diagonal δ_k ■ structural zero
■ overlap penalty λ block of fixed left endpoint i

Non-zero entries: 195 out of $K \cdot K = 225$. Envelope needs $2K = 30$ integers — compression about 7.5x at $n = 6$, growing as $\Theta(K)$ for larger n .

(b) Envelope curve: $\mathcal{O}(K)$ memory suffices

■ diagonal δ_k ■ λ inside envelope —●— envelope ($l_{\min}(k)$, $l_{\max}(k)$)
